AI-NATIVE ENGINEERING

NEMESIS AGENT STUDIO

The Next Generation Autonomous Engineering Platform

Bridging the gap between static code completion and autonomous, production-verified software delivery.

DESIGN
Architectural blueprints

BUILD
Multi-file code synthesis

VERIFY
Sandbox testing + repair

POWERED BY NVIDIA NEMOTRON • NEBIUS TOKEN FACTORY

AI coding is fast. Shipping reliable software is not.

Today’s assistants often stop at code generation—leaving developers to discover runtime failures, stale dependencies and security gaps.

01 Shallow AI coding

Code is generated in a vacuum, without validating real runtime constraints or the target environment.

02 Hallucination loops

Rare exceptions and outdated libraries can trigger repetitive, broken fixes instead of useful recovery.

03 Inference latency bottlenecks

Slow multi-turn reasoning makes agentic reflection expensive. A 15+ second loop interrupts engineering flow.

04 Knowledge cutoffs

Offline models can miss newly disclosed CVEs and recently changed package APIs.

THE GAP: from plausible code to software that actually runs, passes checks and can be trusted.

Meet Nemesis: an engineering loop that builds, tests and heals.

An orchestrated multi-agent studio combining live intelligence, code synthesis and isolated execution.

01

ARCHITECT AGENT

Creates structural blueprints, component boundaries and interface contracts.

02

TAVILY INTELLIGENCE

Retrieves current documentation, package guidance and security advisories.

03

CODE SYNTHESIZER

Generates complete, coordinated multi-file codebases from the plan.

04

SANDBOX CRITIC

Runs generated code in isolated containers and inspects test/runtime results.

05

SELF-HEALING AGENT

Reflects on stack traces and applies targeted AST-level patches automatically.

PLAN Architect → **GROUND** Live intelligence → **GENERATE** Code synthesis → **EXECUTE** Sandbox critic → **REPAIR** Self-healing

A continuous feedback loop—not a one-shot code completion.

High-throughput inference. Grounded reasoning. Faster iteration.

The platform is designed to make multi-agent reflection practical by reducing the time between action, feedback and repair.

NEBIUS TOKEN FACTORY

NVIDIA H100 SXM5 infrastructure

108+ tokens/sec throughput
Sub-200ms time to first token

Targeting a reduction in agent turnaround from 14s to 2.8s.

NVIDIA NEMOTRON-70B

Reasoning-oriented model foundation for structured planning, code analysis and high-precision reflection—supporting more deliberate agent decisions.

TAVILY WEB SEARCH

Live retrieval grounds generation in current package documentation, implementation guidance and CVE/security advisories—reducing reliance on stale model knowledge.

108+
Tokens per second throughput

<200ms
Time to first token

2.8s
Target agent turnaround

Performance figures are presented as supplied in the pitch content; validate against measured workloads before external publication.

Built for teams where software reliability is the product.

Nemesis targets engineering workflows with high costs of failure and clear value from autonomous remediation.

ENTERPRISE DEVSECOPS

Automate investigation and remediation of CI/CD pipeline failures, dependency issues and CVE-driven security vulnerabilities.

IoT & EDGE DEVELOPERS

Accelerate synthesis and validation of hardware-aware applications for NVIDIA Jetson and edge deployments.

SAAS SUBSCRIPTION MODEL

Freemium entry point, with paid tiers offering dedicated Nebius cluster quotas, higher usage limits and team collaboration features.
